

# Corn Snake

Not all snakes are venomous; some are just down right corny! Slither over here to learn more.

Corn snakes are slender, orange or brownish-yellow snakes with a pattern of large, red blotches outlined in black down their backs.

The name corn snake originated from the similarity of these markings to the chequered pattern of kernels of corn.

Native to the United States, corn snakes can grow up to two meters in length and inhabit wooded groves, meadowlands, and rocky open areas.

**What do you call a funny snake?**  
Hisssssterical.

**Scientific Name:**  
Pantherophis guttatus

**Class:** Reptile

**Lifespan:** 6-8 years

**Threats:** Habitat destruction and accidental killing.

**Distribution:** North America

**Habitat:** Forests, rocky grassland and abandoned buildings.

**Length:** Up to 5 inches diameter

**Weight:** Around 1000 grams

**Diet:** Mice and other small mammals

**Housing:** Vivarium

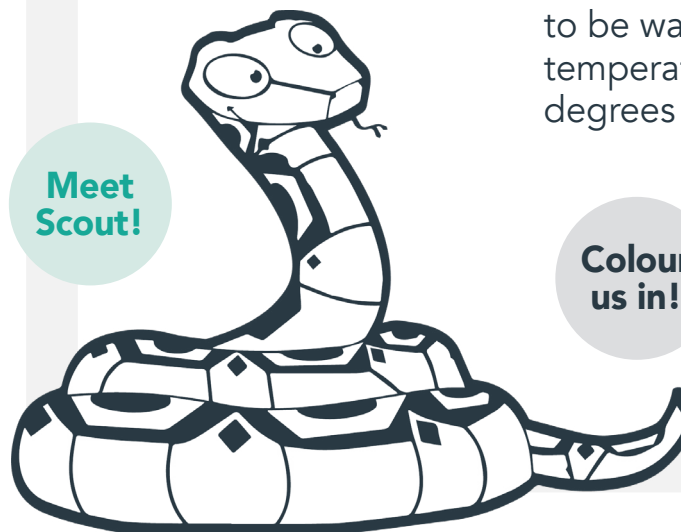

**Things To Know:** Corn Snakes need a vivarium to live in with aspen bedding on the floor of the tank.

They require a water bowl and branches for climbing. A shelter helps them to feel safe too.

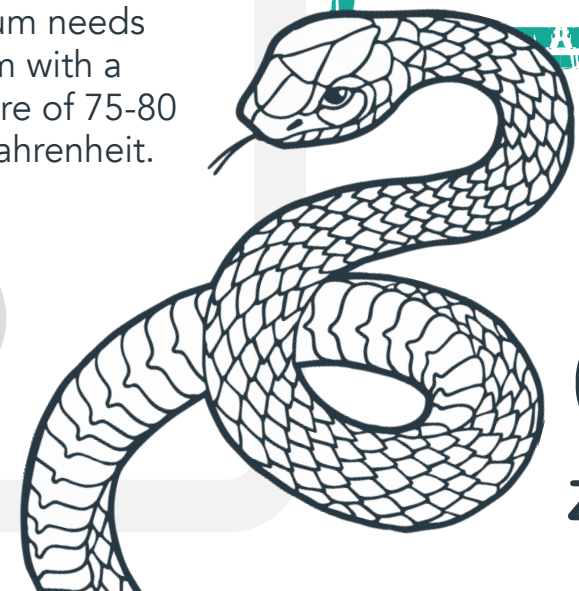

The vivarium needs to be warm with a temperature of 75-80 degrees Fahrenheit.

**FACT FILE:**  
The colour depends on their habitat as it provides camouflage. The belly of a corn snake looks like a kernel of Indian corn, hence the name.
